Kellie Hucker

Cybersecurity Analyst | Network Security | Security Operations | GRC

San Francisco, CA | khucker3d@gmail.com | linkedin.com/in/khucker3d | github.com/khucker3d

PROFESSIONAL SUMMARY

Detail-oriented cybersecurity student and career-transition professional with hands-on experience in network security, Linux administration, SIEM fundamentals, security monitoring, and technical documentation. Built and documented a Raspberry Pi network utility server supporting DNS filtering, infrastructure uptime monitoring, host health metrics, secure administration, shared transfer workflows, and backup/recovery procedures. Brings investigative discipline from U.S. Army Military Police service and extensive technical production experience in automation, validation, troubleshooting, and cross-functional support.

EDUCATION & CERTIFICATES

- Google Cybersecurity Professional Certificate - March 2026
- Google IT Support Profession Certificate - June 2026
- Google Network Security Certificate - June 2026
- U.S. Army Military Police Basic and Advanced Individual Training - March 1999

TECHNICAL & BUSINESS SKILLS

- Security Tools & Platforms: Wazuh, OpenSearch, Pi-hole, Uptime Kuma, Netdata, Docker, Docker Compose, VMware, VirtualBox, VPNs, endpoint protection
- Networking & Infrastructure: DNS, DHCP reservations, LAN monitoring, network device uptime checks, Wi-Fi configuration, TP-Link Omada, SSH administration, Samba file sharing
- Operating Systems: Windows, macOS, Ubuntu Linux, Kali Linux, Raspberry Pi OS, iOS, Android
- Scripting & Automation: Python, Bash fundamentals, HTML, JavaScript, PHP, XML; VS Code, PyCharm, Rider
- Security Concepts: SIEM fundamentals, log ingestion and analysis, alert validation, MITRE ATT&CK awareness, basic hardening, access control, vulnerability awareness, backup/recovery, incident runbooks
- Professional Strengths: Investigative mindset, problem-solving, detailed documentation, clear communication, cross-functional collaboration, live user support, adaptability, operational discipline, calm under pressure

PROJECTS

Raspberry Pi Network Utility Server — July 2026

- Built and documented an internal Raspberry Pi network utility server to support home-lab security operations, infrastructure monitoring, DNS visibility, and operational reliability.
- Deployed Pi-hole for DNS filtering and query visibility; validated DNS resolution from test devices before expanding trusted-device usage.
- Deployed Uptime Kuma in Docker to monitor core network services and devices, including the Omada controller, router, access point, Pi-hole, Netdata, and switch availability.
- Configured Discord alerting and performed a safe test outage to validate DOWN and recovery notifications for operational monitoring workflows.
- Deployed Netdata in Docker for host health monitoring, including CPU, memory, disk, network, container, and temperature visibility on Raspberry Pi OS.
- Implemented secure SSH administration practices, internal-only service exposure, no WAN port forwarding, and management access limited to trusted admin devices.
- Documented backup and recovery procedures for Pi-hole, Uptime Kuma, and Netdata, including service configuration backups, restore planning, and short runbooks.
- Designed a public documentation boundary separating publishable architecture and workflow diagrams from sensitive internal implementation details.

Enterprise Home Network — May 2026

- Designed and upgraded a home network using a TP-Link Omada stack, including an ER605 router, OC200 hardware controller, TL-SG108PE PoE switch, and EAP610 Wi-Fi 6 access point.
- Planned a segmented network architecture to separate personal devices, cybersecurity lab systems, guest access, and future IoT devices.
- Documented network topology, device adoption, SSID planning, cabling standards, fallback procedures, and safe transition steps from the existing Xfinity modem/router setup.
- Applied cybersecurity best practices including stronger Wi-Fi configuration, management-plane awareness, reduced device trust boundaries, and controlled lab isolation.

BLE Anomaly Scanner — May 2026

- Built a portable Bluetooth Low Energy scanner using an ESP32-S3 device to detect nearby BLE devices and display real-time signal strength, device names, MAC addresses, and RSSI history.
- Designed a lightweight anomaly-scoring system to flag suspicious BLE activity based on signal strength changes, unknown devices, repeated sightings, and unusual proximity behavior.
- Implemented a trusted-device list, freeze mode, device detail view, paging controls, visual RSSI indicators, and serial CSV output for later analysis.
- Strengthened understanding of wireless reconnaissance, embedded security tooling, IoT visibility, and defensive monitoring concepts.

Secure File Locker — April 2026

- Built a cross-platform desktop file encryption tool using Python and Tkinter to encrypt and decrypt local files without relying on cloud storage.

- Implemented AES-256 encryption using AES-GCM, PBKDF2 password-based key derivation, and HMAC-based integrity protection.
- Added password hints, failed-attempt tracking with lockout protection, drag-and-drop support, safe unlock copy mode, permanent unlock mode, and password change functionality.
- Documented security limitations, including no password recovery, local lockout bypass risks, memory limits for large files, and lack of hardware-backed key storage.

PNG Steganography Generator April 2026

- Built a cross-platform Python GUI tool that hides encrypted secret messages inside PNG images using least significant bit steganography.
- Implemented password-based encryption before embedding messages using PBKDF2 key derivation, Fernet symmetric encryption, and a random salt per encoded message.
- Added capacity indicators, password confirmation, overwrite warnings, drag-and-drop decryption flow, and clipboard copy for extracted messages.

Home Lab Detection July 2025

- Designed a modular, enterprise-style security lab applying systems-thinking from technical art pipelines to network security architecture.
- Built and monitored an Active Directory environment with endpoint telemetry and Wazuh SIEM visibility.
- Engineered detection rules and alerting pipelines for authentication-based attacks, including brute force, password spraying, and account lockouts.
- Mapped detections to MITRE ATT&CK techniques and produced Confluence-style documentation and incident response playbooks.

Secure Device Decommissioning & Rebuild July 2025

- Assessed TPM, Secure Boot, partition, and encryption state on a personally owned Windows laptop affected by legacy enterprise BitLocker controls.
- Upgraded storage, performed a full disk wipe, installed Windows 11 Pro, validated TPM and Secure Boot, and installed Kali Linux in a dual-boot configuration.
- Validated boot selection, connectivity, package updates, storage layout, and baseline readiness for cybersecurity lab use.

RELATED EXPERIENCE

Asset Infrastructure - Various AA & AAA Game Studios January 2009 - January 2026

- Worked with secured repositories supporting large-scale asset pipelines and structured technical production workflows.
- Configured repository access using SSH key authentication; generated and managed SSH keys, configured .ssh permissions, and validated remote connectivity.
- Performed branch creation, rebasing, merging into main, and pull request submissions in collaborative development environments.
- Developed automation scripts to validate assets, enforce consistency, and reduce manual review effort.
- Collaborated cross-functionally to define structured, auditable workflows for asset deployment and technical review.
- Configured test environments to assess integrity and compatibility across devices, platforms, and production constraints.
- Authored detailed technical documentation, tooling guides, and operational procedures for artists, engineers, and production teams.

Military Police / Team Leader - U.S. Army September 1998 - December 2001

- Conducted field investigations involving military violations and suspicious activity; documented incidents and compiled detailed investigative reports.
- Operated surveillance and detection equipment to protect high-value personnel and assets in high-risk environments supporting NATO stabilization missions.
- Applied operational discipline, chain-of-custody awareness, calm decision-making, and structured communication under pressure.
